

Critical Evaluation of AI's Response

The AI's answer is quite good and detailed. It properly handles the imbalance problem using XGBoost and SMOTE which is very important. It also talks about feature engineering and real-time system nicely.

However, it has some weaknesses like no specific accuracy numbers from other datasets and less information about Bangladesh Bank rules. It felt a bit general in some parts.

I think LightGBM or XGBoost with `scale_pos_weight` and SHAP is the most suitable model because it is fast and easy to explain.

System Architecture Design :
